

# Procedural Generation of Landscapes with Water Bodies Using Artificial Drainage Basins

**Roland Fischer**, Judith Boeckers, Gabriel Zachmann

University of Bremen, Bremen, Germany

[r.fischer@uni-bremen.de](mailto:r.fischer@uni-bremen.de)

*CGI 2022 – LNCS Proceedings Track*

*12-16 September, Geneva, Switzerland*

# Motivation

- Growing interest in procedural 3D landscapes

# Motivation

- Growing interest in procedural 3D landscapes

The Good Dinosaur [Disney/Pixar]

- Growing interest in procedural 3D landscapes

The Good Dinosaur [Disney/Pixar]

Ghost Recon: Wildlands [Ubisoft]

- Growing interest in procedural 3D landscapes

The Good Dinosaur [Disney/Pixar]

Ghost Recon: Wildlands [Ubisoft]

VaMEx-VTB [University of Bremen]

- Growing interest in procedural 3D landscapes
- Balance of control & automation is challenging

The Good Dinosaur [Disney/Pixar]

Ghost Recon: Wildlands [Ubisoft]

VaMEx-VTB [University of Bremen]

- Growing interest in procedural 3D landscapes
- Balance of control & automation is challenging
- Landscapes with natural-looking water bodies important yet under-explored

The Good Dinosaur [Disney/Pixar]

Ghost Recon: Wildlands [Ubisoft]

VaMEx-VTB [University of Bremen]

## Subdivision & Noise

[Parberry15,Thorimbert16]

- Quick & easy
- Unintuitive parameters
- Unrealistic globally

## Simulation

[Stava08,Cordonnier16]

- More realistic
- Very slow

## Example-based

[Zhou07,Guérin17]

- Realistic
- Limited by examples
- Hard to control globally

## Subdivision & Noise

[Parberry15,Thorimbert16]

- Quick & easy
- Unintuitive parameters
- Unrealistic globally

## Simulation

[Stava08,Cordonnier16]

- More realistic
- Very slow

## Example-based

[Zhou07,Guérin17]

- Realistic
- Limited by examples
- Hard to control globally

- Terrain based on river networks

## Subdivision & Noise

[Parberry15,Thorimbert16]

- Quick & easy
- Unintuitive parameters
- Unrealistic globally

## Simulation

[Stava08,Cordonnier16]

- More realistic
- Very slow

## Example-based

[Zhou07,Guérin17]

- Realistic
- Limited by examples
- Hard to control globally

- Terrain based on river networks
  - Procedurally created river networks (e.g. midpoint displacement) [Kelly88,Teoh09,Derzapf11]

[Teoh09]

## Subdivision & Noise

[Parberry15,Thorimbert16]

- Quick & easy

- Unrealistic globally

## Simulation

[Stava08,Cordonnier16]

- More realistic
- Very slow

## Example-based

[Zhou07,Guérin17]

- Realistic
- Limited by examples
- Hard to control globally

- Terrain based on river networks
  - Procedurally created river networks (e.g. midpoint displacement) [Kelly88,Teoh09,Derzapf11]
  - River graphs based on sketches and hydrological knowledge [Geneveaux13,Zhang16]

[Teoh09]

[Geneveaux13]

# Our Contributions

- Method for proc. generation of landscapes with focus on water bodies

# Our Contributions

- Method for proc. generation of landscapes with focus on water bodies
  - „River-first“ approach: after initial authoring, water bodys (including lakes and river deltas) get computed and dictate the final terrain

# Our Contributions

- Method for proc. generation of landscapes with focus on water bodies
  - „River-first“ approach: after initial authoring, water bodies (including lakes and river deltas) get computed and dictate the final terrain
  - Artificial drainage basins for river distribution inspired by OCN method

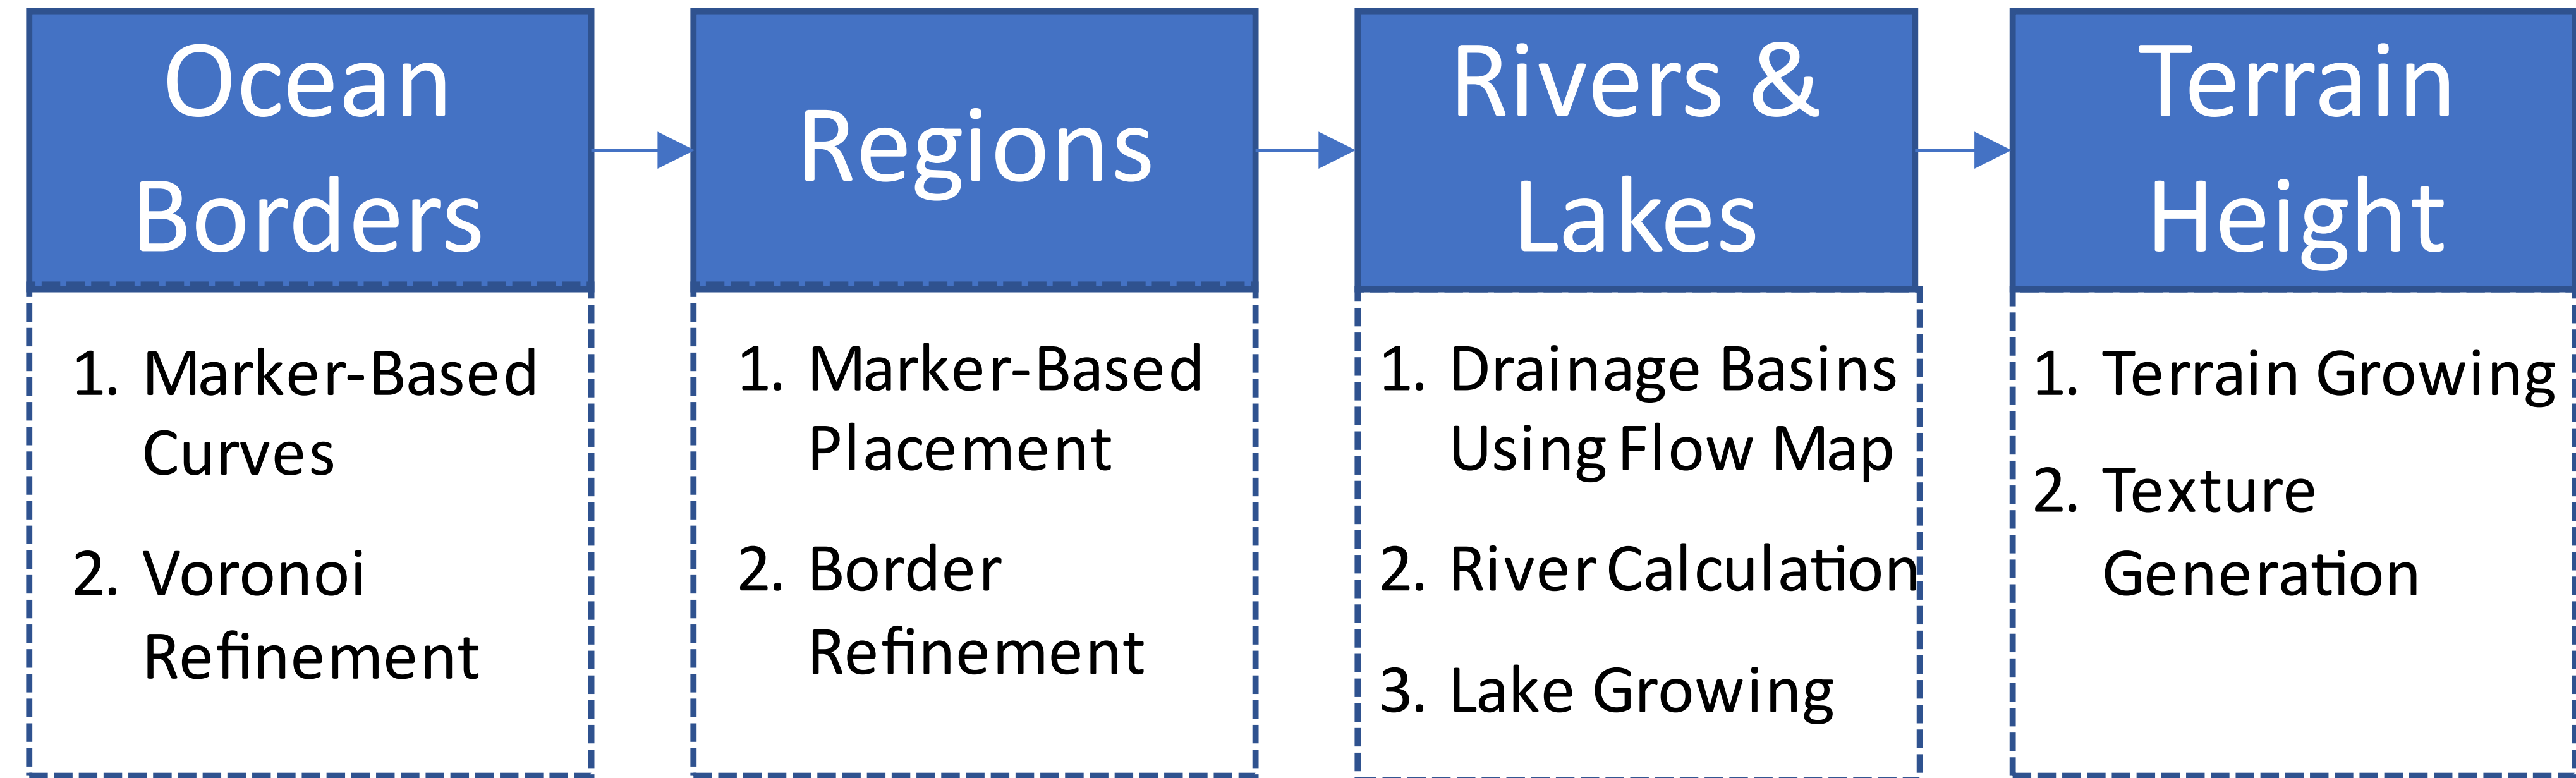

- Method for proc. generation of landscapes with focus on water bodies
  - „River-first“ approach: after initial authoring, water bodies (including lakes and river deltas) get computed and dictate the final terrain
  - Artificial drainage basins for river distribution inspired by OCN method
  - Quick & agile pipeline approach implemented in Unity3D

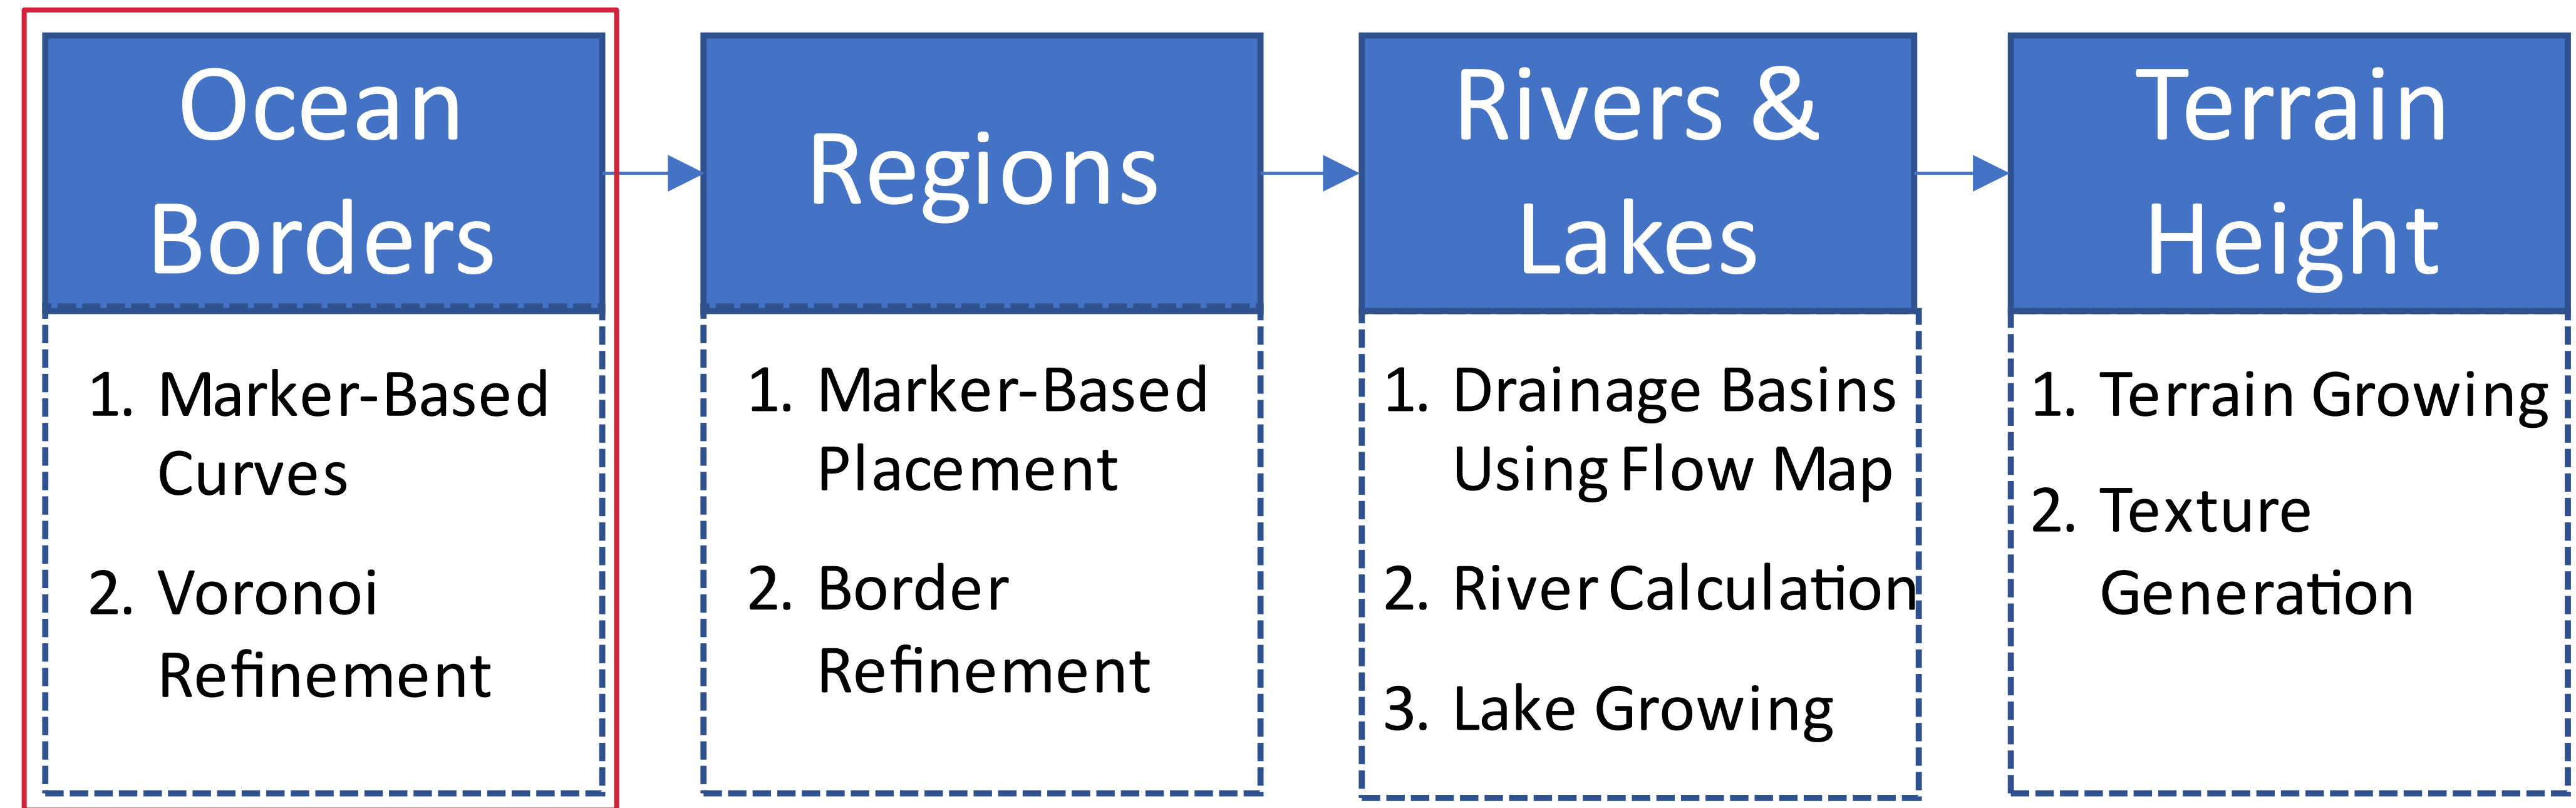

- Method for proc. generation of landscapes with focus on water bodies
  - „River-first“ approach: after initial authoring, water bodies (including lakes and river deltas) get computed and dictate the final terrain
  - Artificial drainage basins for river distribution inspired by OCN method
  - Quick & agile pipeline approach implemented in Unity3D
- Extensive evaluation including dedicated real-world comparison

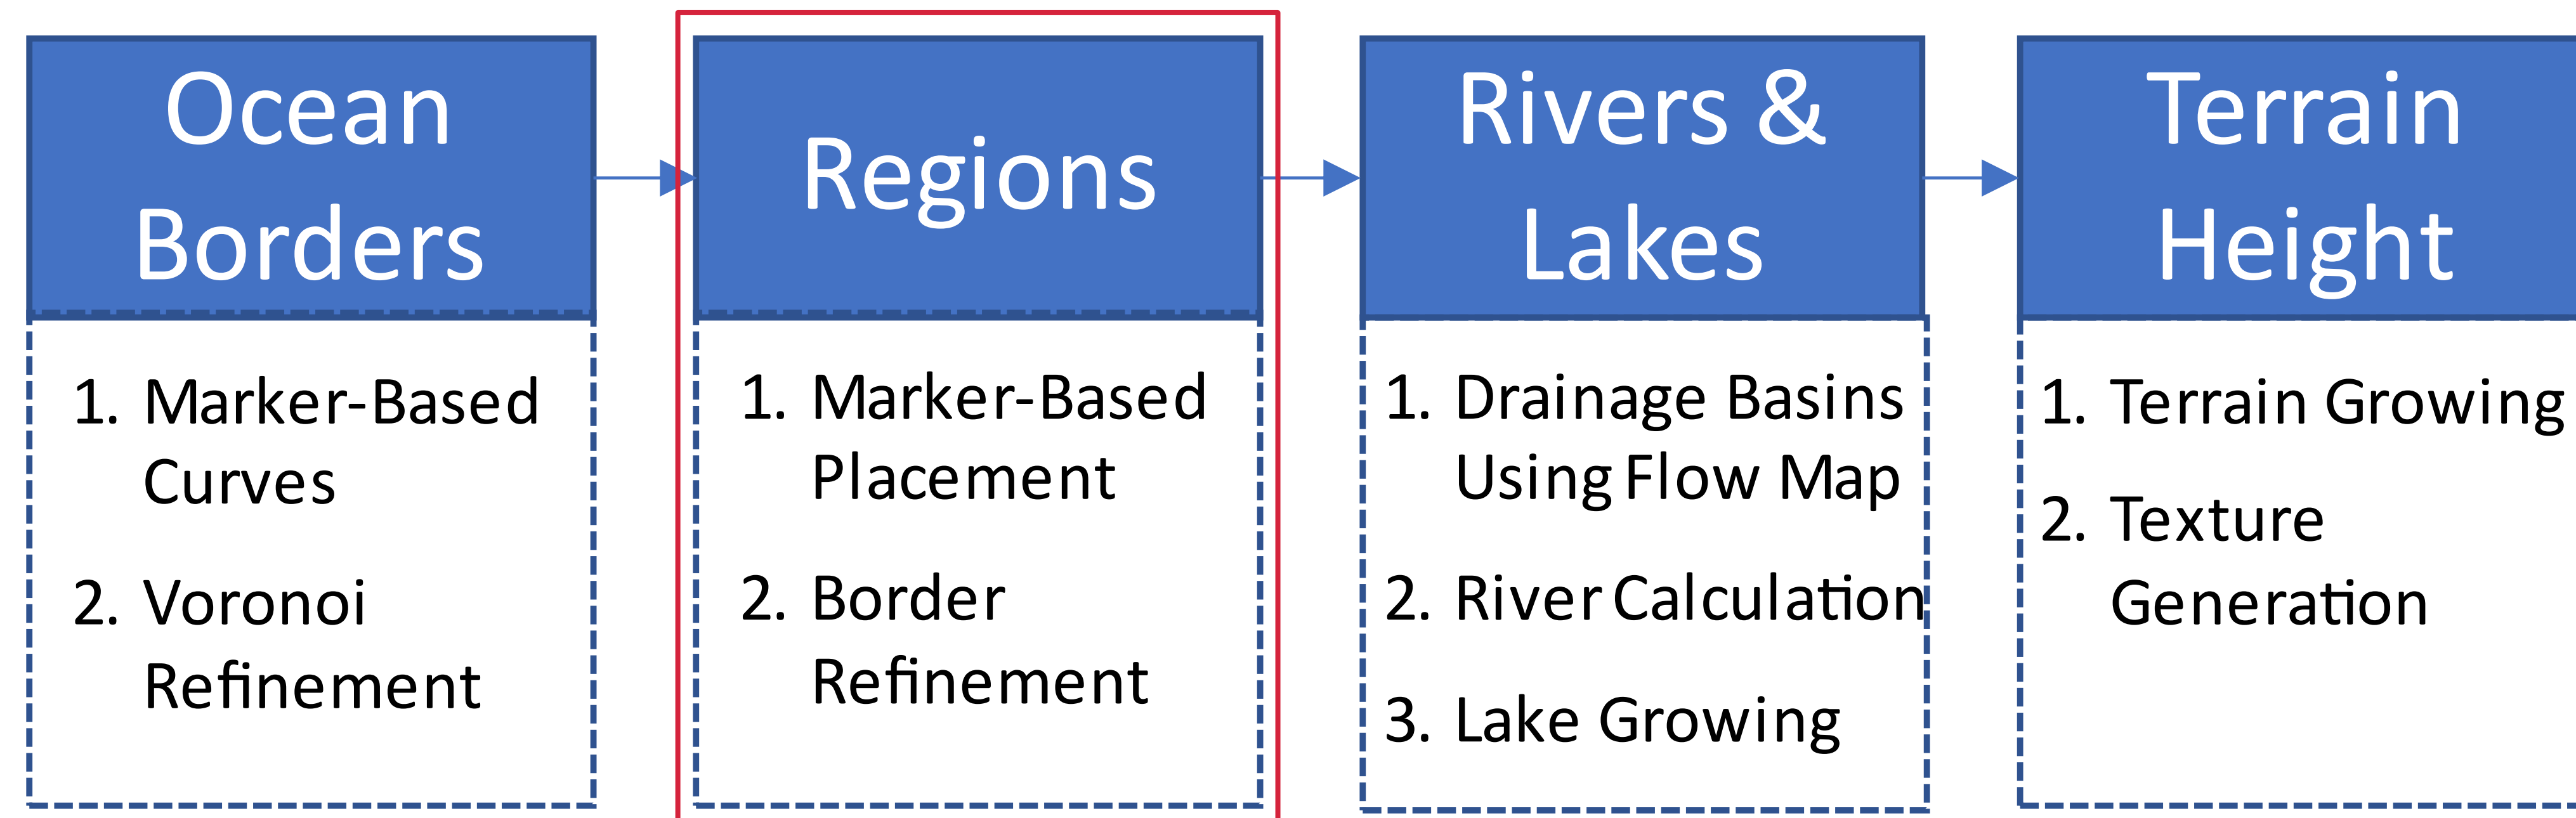

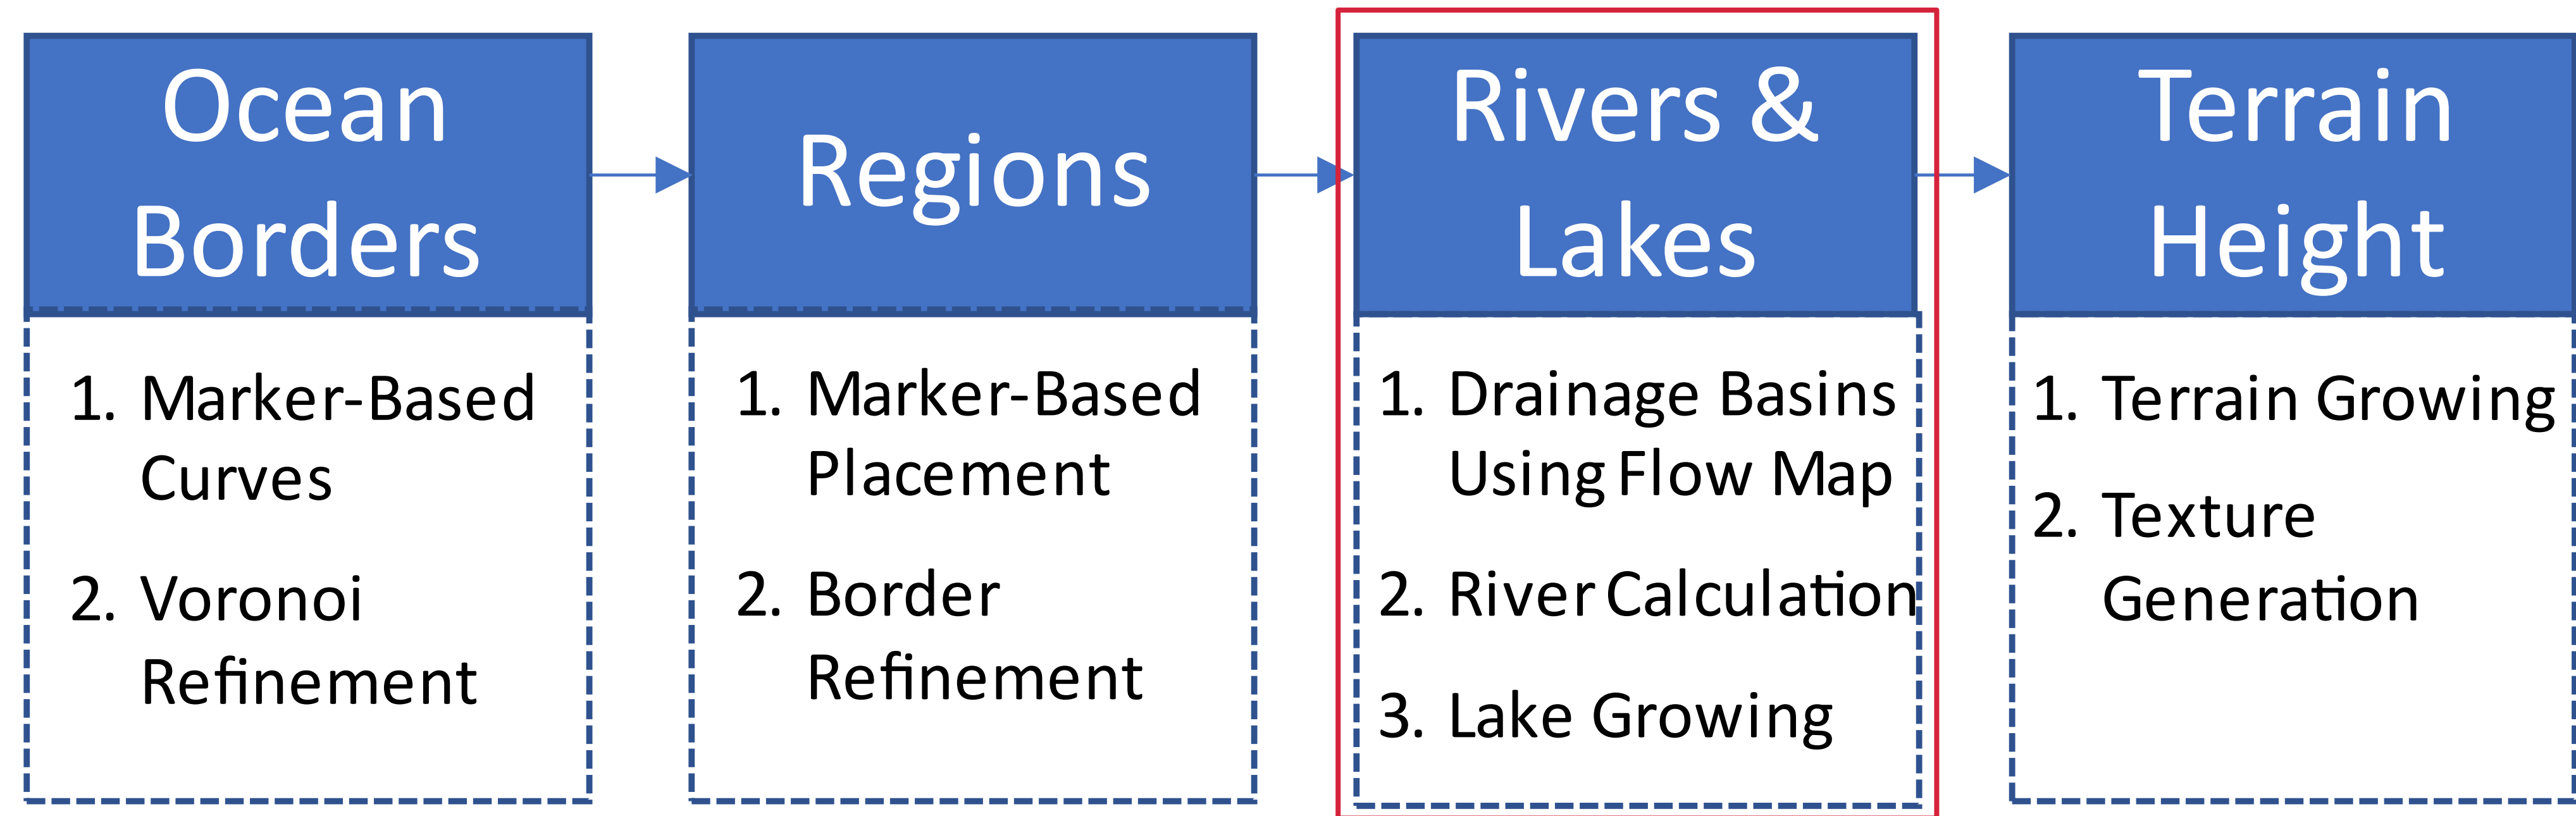

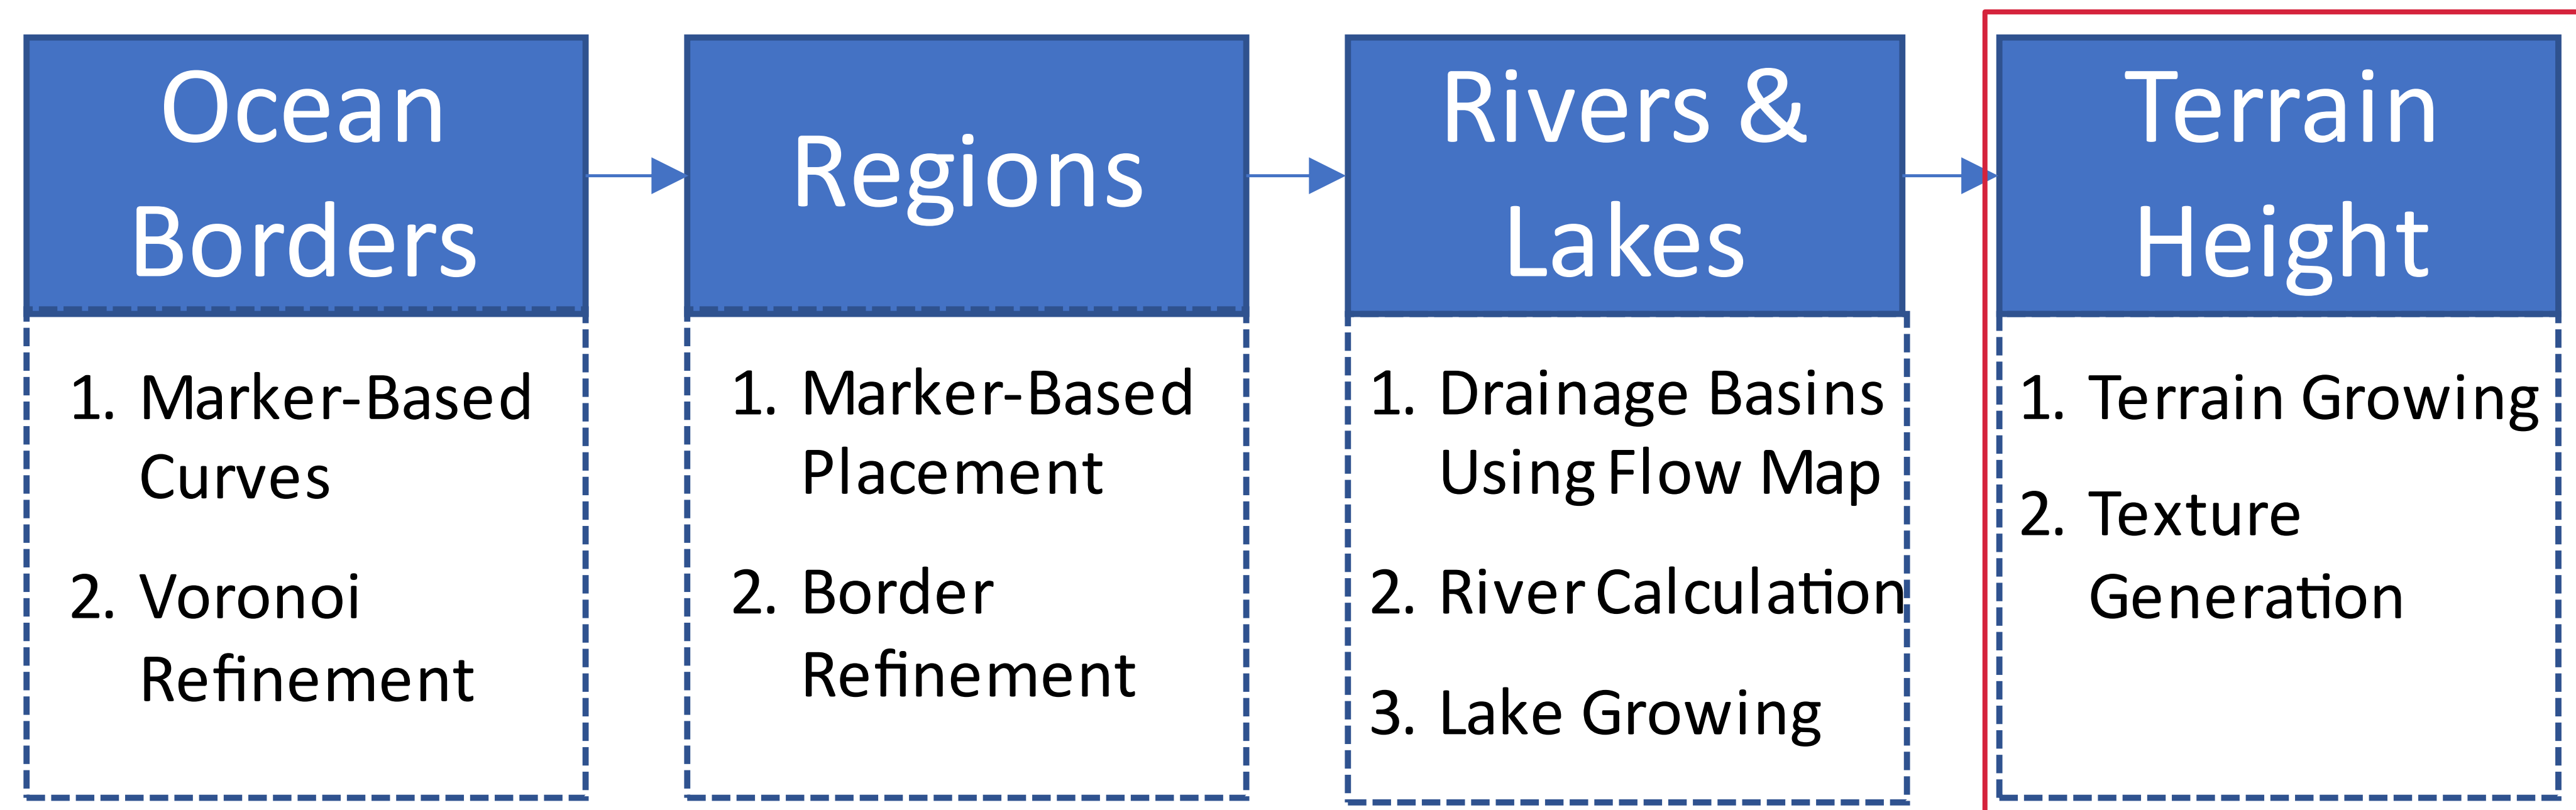

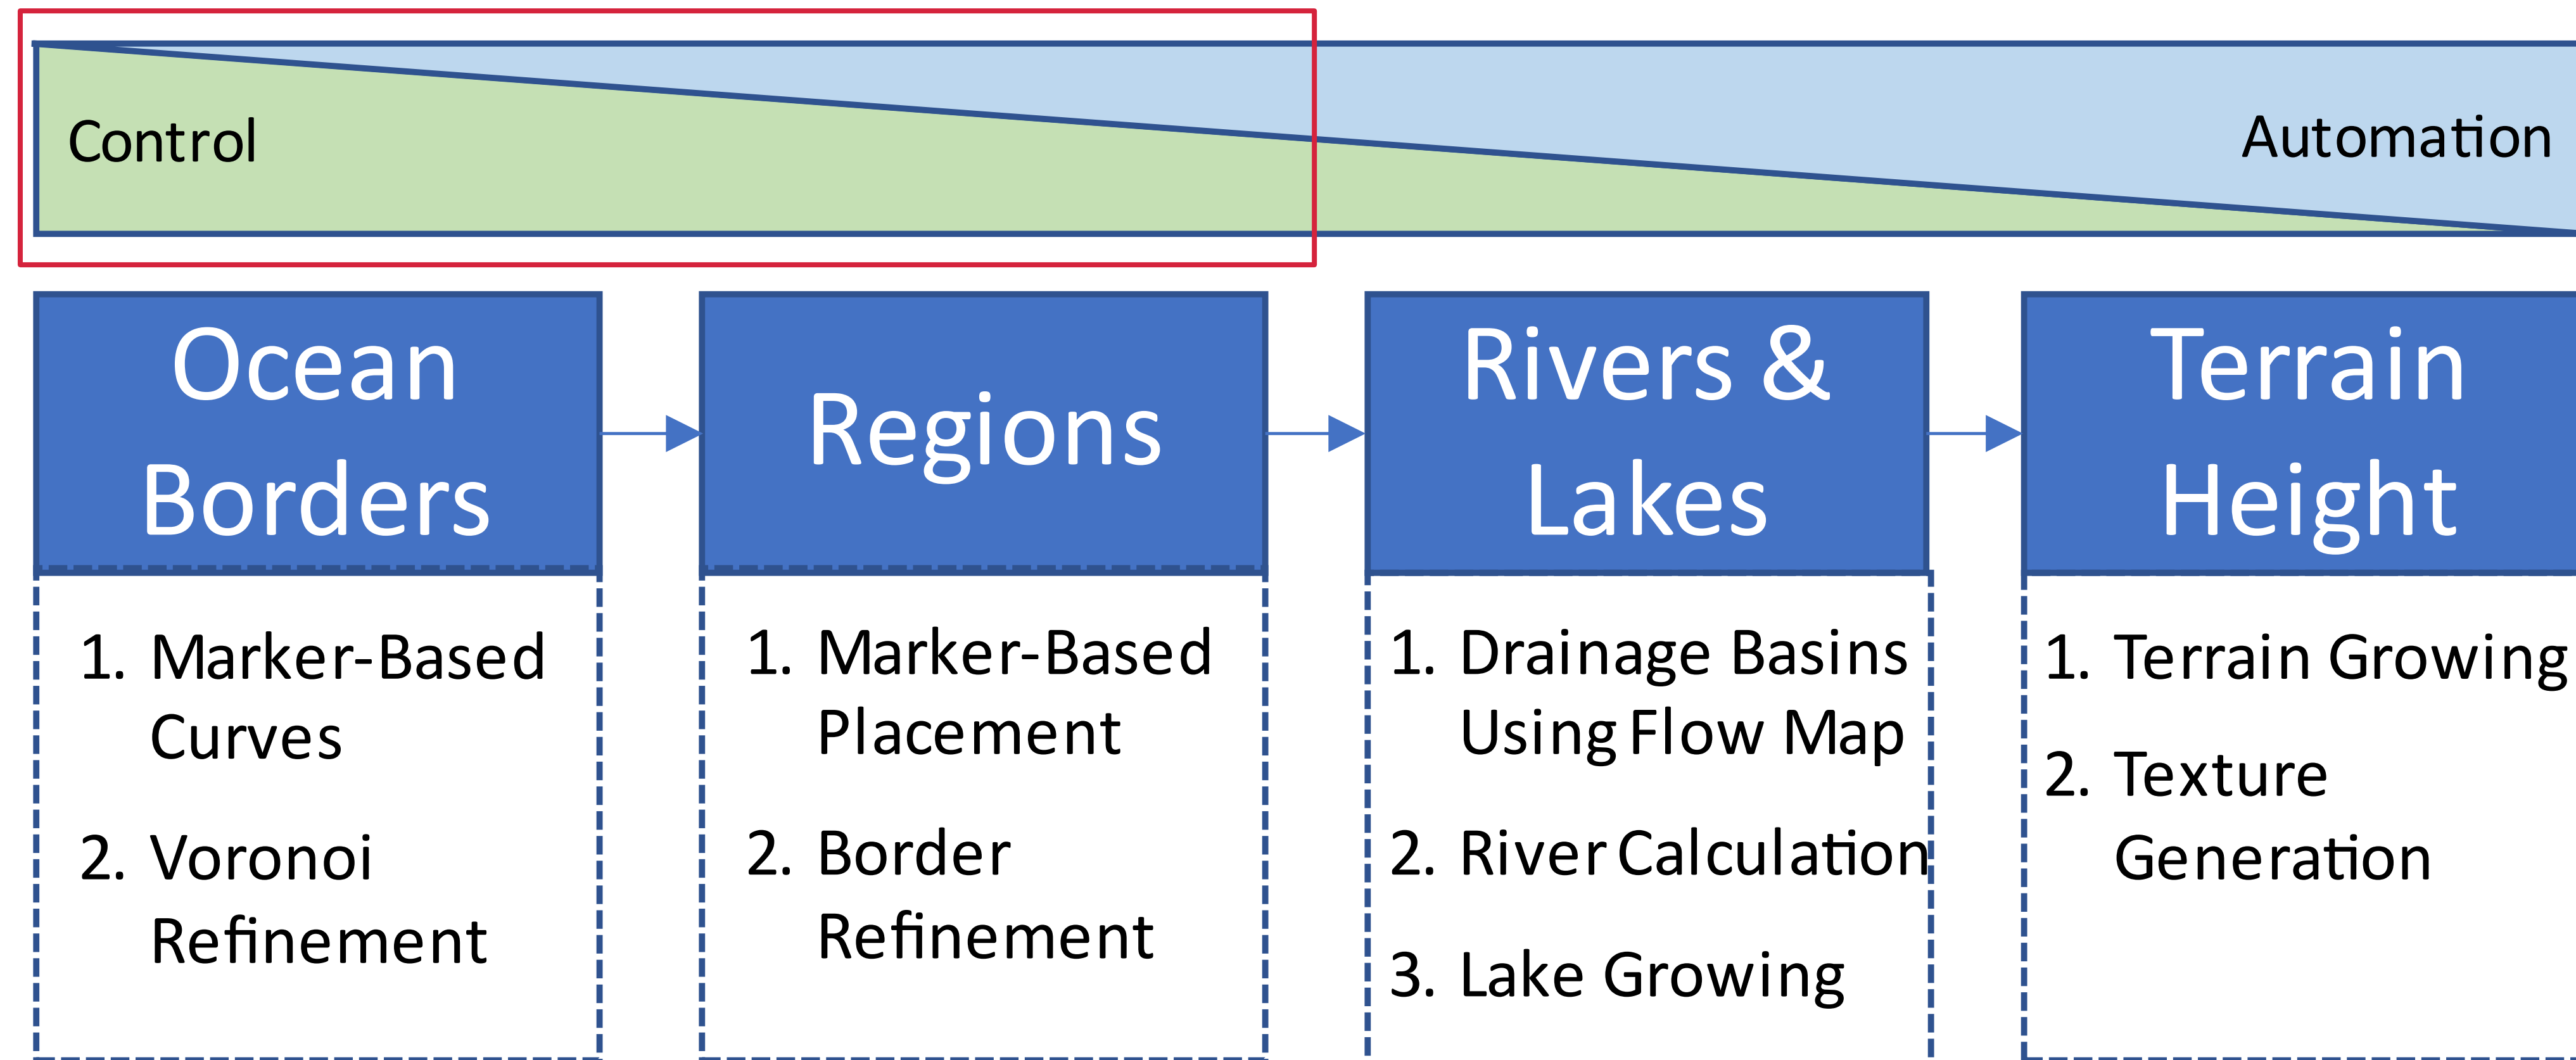

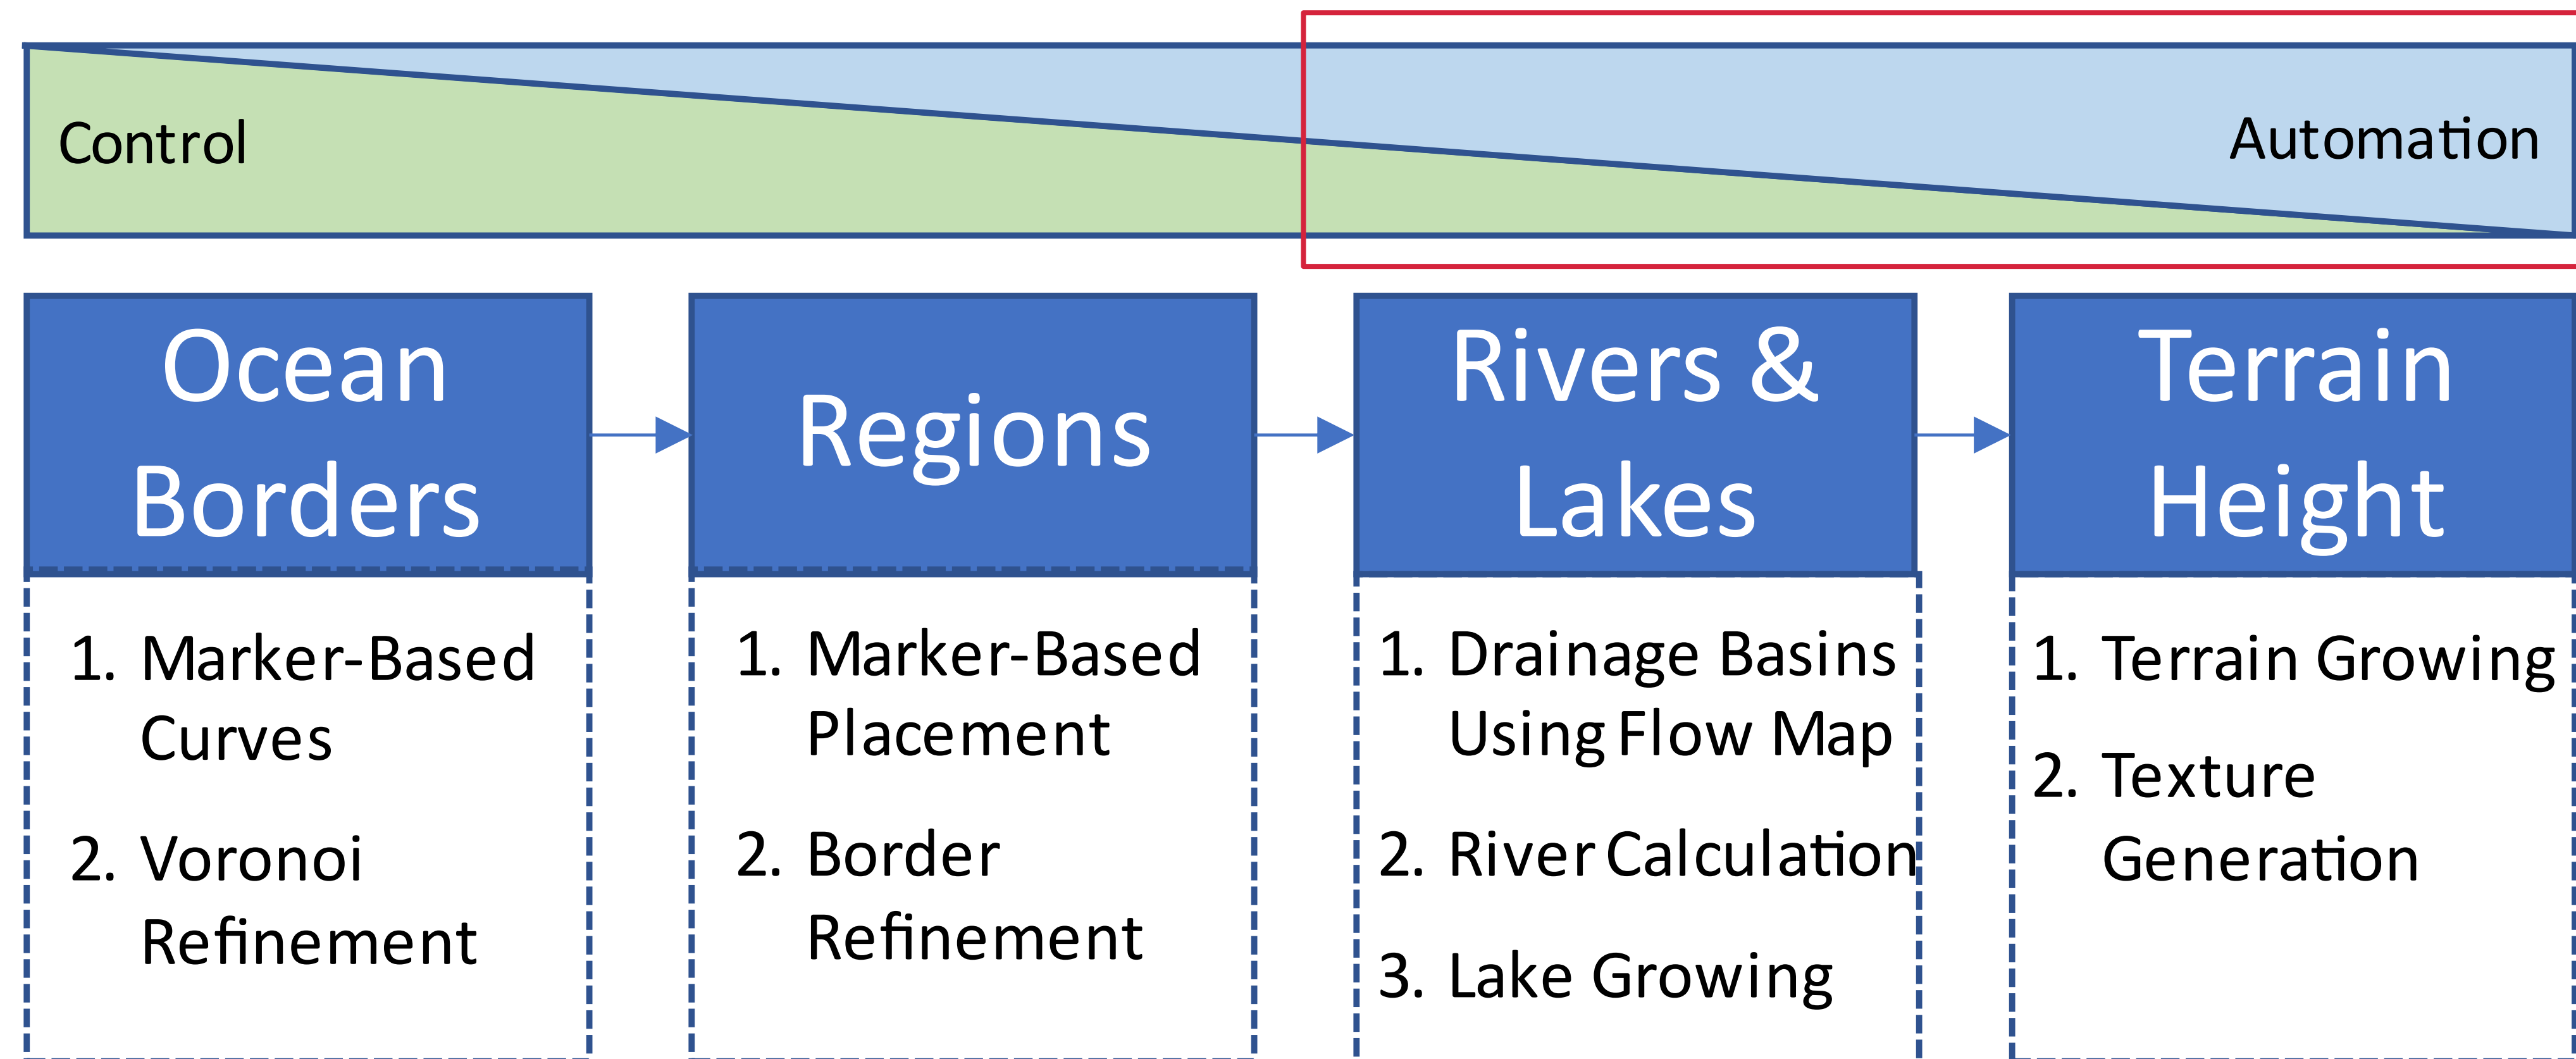

- Spline-based borders for intuitive control

- Spline-based borders for intuitive control
- Iterative refinement with Voronoi diagrams

- Spline-based borders for intuitive control
- Iterative refinement with Voronoi diagrams
  - First iteration:
    - Random placement of Voronoi sights

- Spline-based borders for intuitive control
- Iterative refinement with Voronoi diagrams
  - First iteration:
    - Random placement of Voronoi sights
  - Second iteration:
    - Placement around previous borders
    - Regions grown using noise-based priority queue

- Spline-based borders for intuitive control
- Iterative refinement with Voronoi diagrams
  - First iteration:
    - Random placement of Voronoi sights
  - Second iteration:
    - Placement around previous borders
    - Regions grown using noise-based priority queue

- Spline-based borders for intuitive control
- Iterative refinement with Voronoi diagrams
  - First iteration:
    - Random placement of Voronoi sights
  - Second iteration:
    - Placement around previous borders
    - Regions grown using noise-based priority queue

- User controls distribution of terrain types

- User controls distribution of terrain types
- Parameters for extent and borders (randomized using noise, e.g., simplex n.)

# River Networks & Lakes

- Idea: Compute artificial drainage basins to place river networks

# River Networks & Lakes

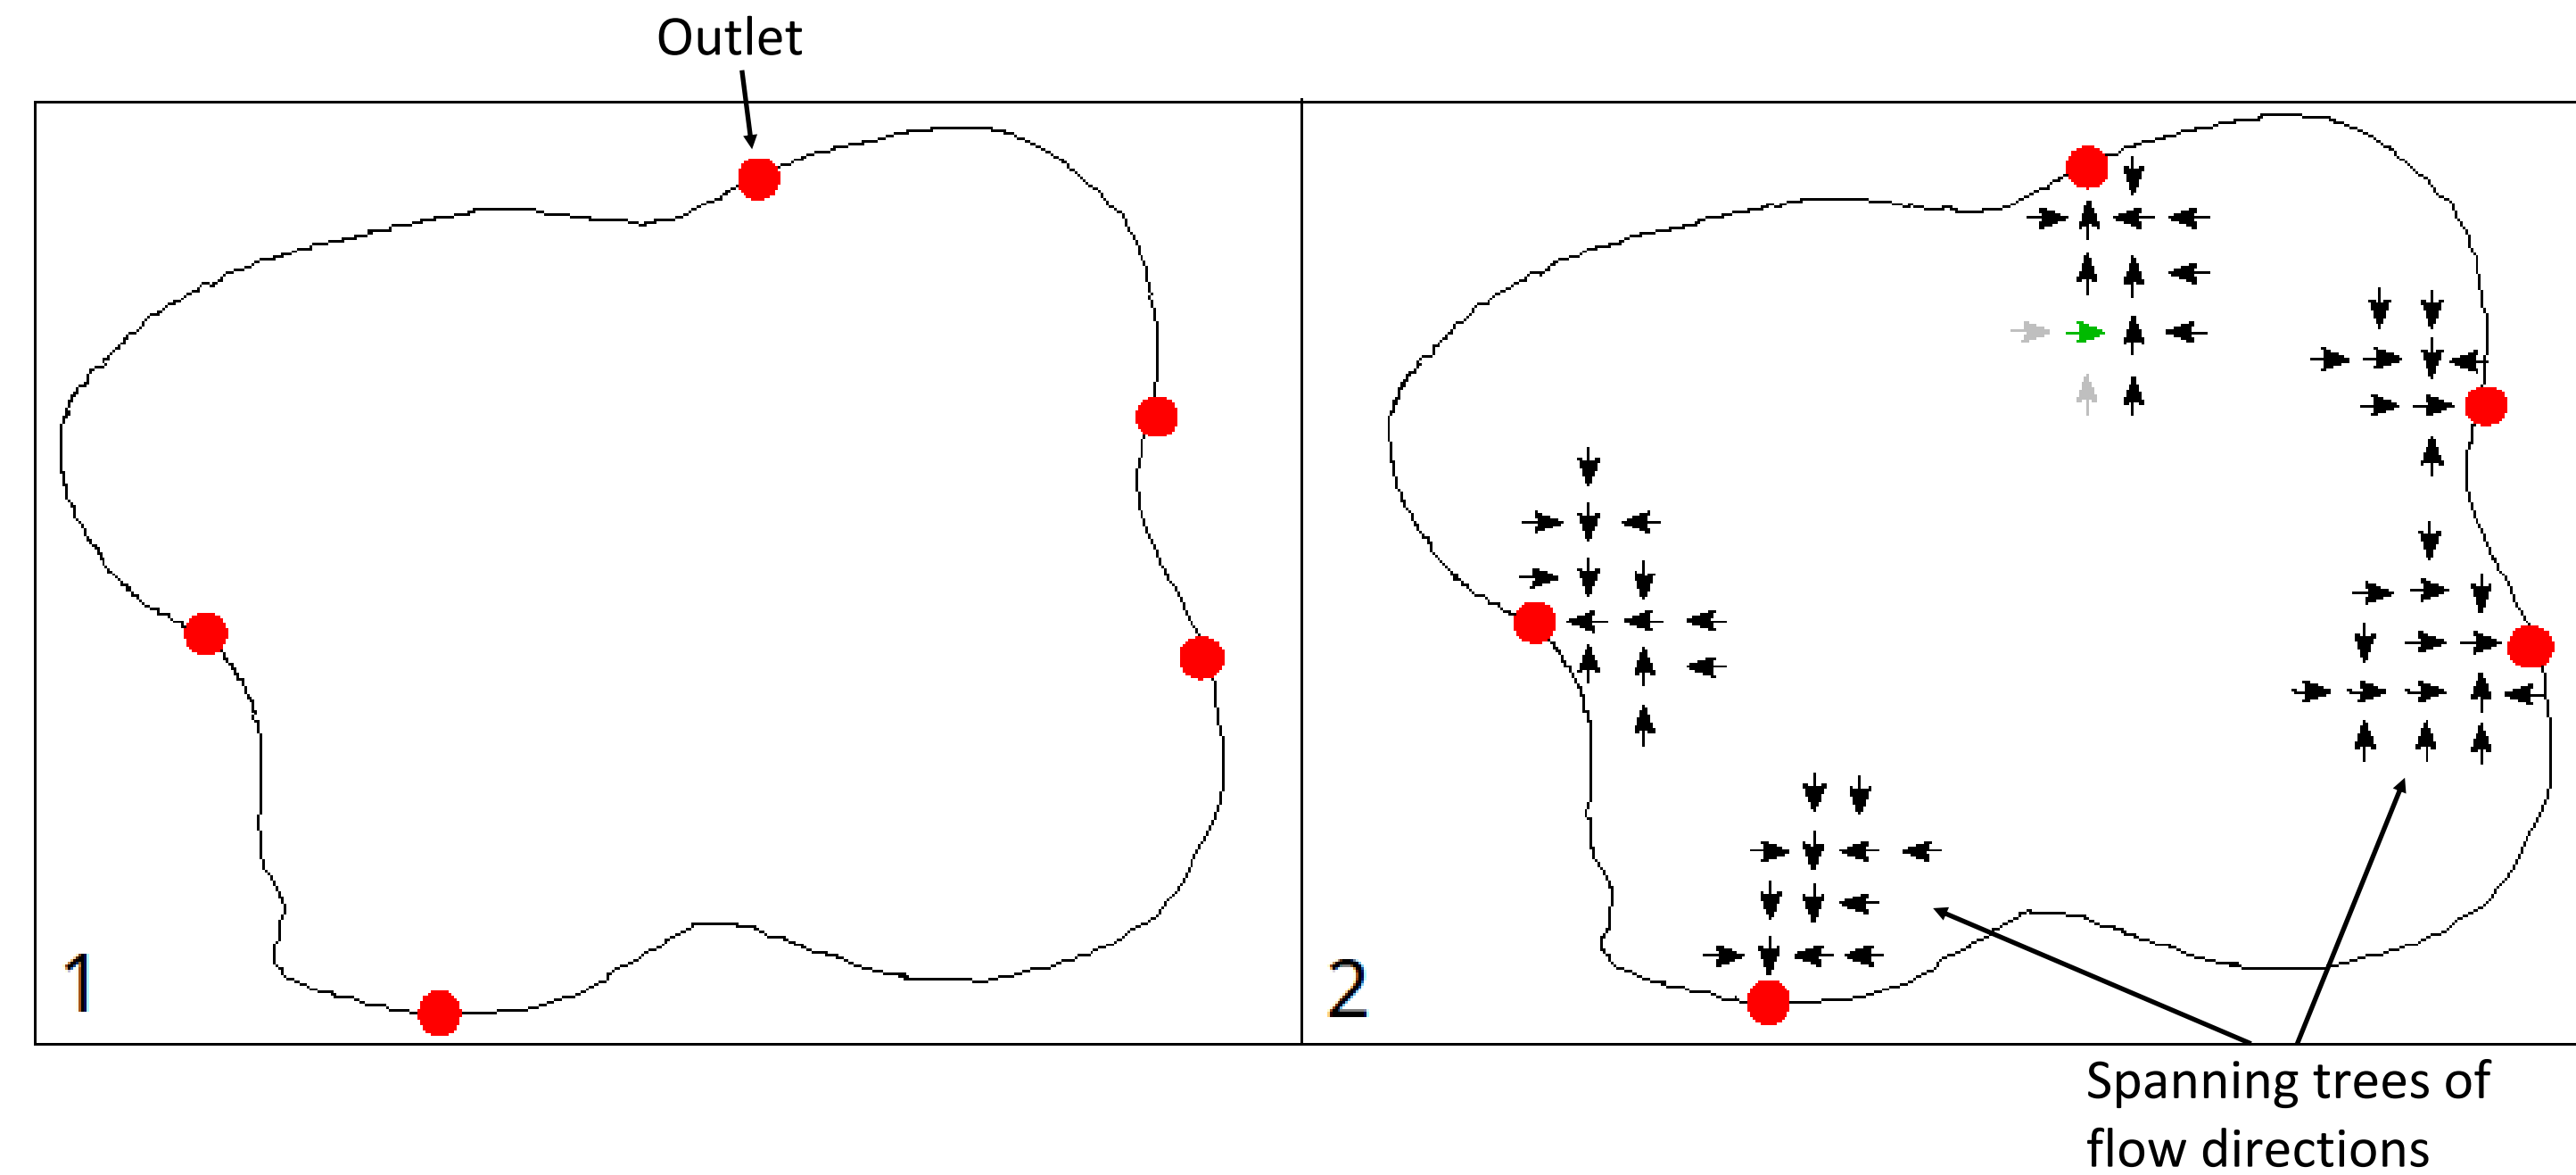

- Idea: Compute artificial drainage basins to place river networks
  - Construct spanning forrest to indicate flow directions

  - Construct spanning forrest to indicate flow directions

# River Networks & Lakes

Rivers gain strength/width

Rivers gain strength/width

Distinct river deltas

Rivers gain strength/width

Distinct river deltas

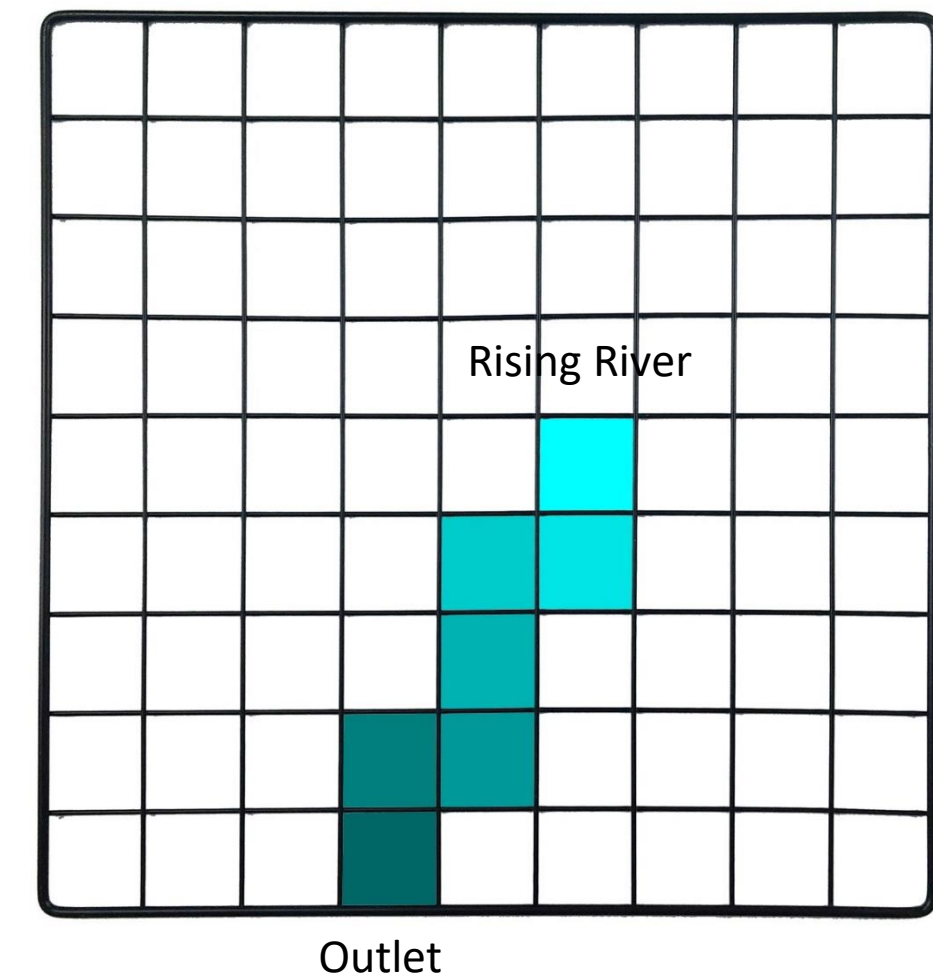

Final example

- Grown starting from water bodies

- Grown starting from water bodies
  - Initial river height increases from outlets

- Grown starting from water bodies
- Initial river height increases from outlets
- Grow land in order of height-based priority queue

- Grown starting from water bodies
  - Initial river height increases from outlets
  - Grow land in order of height-based priority queue
  - Growth depends on region-based steepness and noise

# Visualization

- Low resolution mesh for visualization during workflow

# Results: Performance

- Complexity of  $O(n)$   
n: number of grid cells

System Specification

Item	Details
CPU	Intel Core i7 7800x
GPU	Nvidia GeForce 2070
RAM	16 GB
OS	Windows 10

- Complexity of  $O(n)$   
n: number of grid cells
- Breakdown of timings:

OS	Windows 10

- Complexity of  $O(n)$   
n: number of grid cells
- Breakdown of timings:

- Also other significant parameters:

Step	Substep	Time (ms)
Borders	Refine (1. iteration)	851
	Refine (2. iteration)	1601
	Refine (2. iteration+Noise)	7600
Rivers	Calculate Drainage Basins	796
	Compute Rivers+Lakes	100
Visual.	Generate Mesh	800
	Generate Textures	3426

# Results: Examples

# Results: Real World Comparision

DEM from Severo-Evensky District in Magadan Oblast in Russia (61.21703, 160.21836)

# Results: Real World Comparision

DEM from Severo-Evensky District in Magadan Oblast in Russia (61.21703, 160.21836)

# Conclusion

- New system for procedural generation of landscapes with water bodies

- New system for procedural generation of landscapes with water bodies
  - Natural river integration through „river-first“ approach

# Conclusion

- New system for procedural generation of landscapes with water bodies
  - Natural river integration through „river-first“ approach
  - Distribution steered by artificial drainage basins

# Conclusion

- New system for procedural generation of landscapes with water bodies
  - Natural river integration through „river-first“ approach
  - Distribution steered by artificial drainage basins
- Pipeline approach with quick & agile workflow

# Conclusion

- New system for procedural generation of landscapes with water bodies
  - Natural river integration through „river-first“ approach
  - Distribution steered by artificial drainage basins
- Pipeline approach with quick & agile workflow
  - <25s for complete terrain generation

# Conclusion

- New system for procedural generation of landscapes with water bodies
  - Natural river integration through „river-first“ approach
  - Distribution steered by artificial drainage basins
- Pipeline approach with quick & agile workflow
  - <25s for complete terrain generation
  - Carefully balances control (first stages ) & automation (later stages)

# Conclusion

- New system for procedural generation of landscapes with water bodies
  - Natural river integration through „river-first“ approach
  - Distribution steered by artificial drainage basins
- Pipeline approach with quick & agile workflow
  - <25s for complete terrain generation
  - Carefully balances control (first stages ) & automation (later stages)
- Great variability and realistic-looking terrains

# Future Work

- Multiple iterations of river & terrain generation

# Future Work

- Multiple iterations of river & terrain generation
- More landscape features (oxbow lakes, wetlands, cliffs)

# Future Work

- Multiple iterations of river & terrain generation
- More landscape features (oxbow lakes, wetlands, cliffs)
- Parallelization
